Problema de la ONU

Enunciado

ALGORITMO: Ramificación y Acotamiento 1. Inicializar la lista de nodos pendientes con el nodo raíz. 2. Mientras la lista de nodos pendientes no esté vacía, hacer: a. Seleccionar y eliminar un nodo de la lista de nodos pendientes. b. Si el nodo seleccionado es prometedor, entonces: i. Si el nodo seleccionado es una solución completa, comparar con la mejor solución actual. ii. De lo contrario, ramificar el nodo para generar nuevos nodos y agregarlos a la lista. 3. Devolver la mejor solución encontrada.

$$\begin{array}{ll} \max & z = 120x_1 + 80x_2 \\ & 2x_1 + x_2 + x_3 = 6 \\ & 7x_1 + 8x_2 + x_4 \leq 28 \\ & x_3 - .5x_4 = 2.5 \\ & x_i \in Z_+ \quad \text{para todo } i \end{array}$$

Modelo en julia

Por método de ramificación y acotamiento se tiene el siguiente modelo en julia

Primero realizamos un simplex normal:

```
using JuMP, HiGHS
model = Model(HiGHS.Optimizer)
@variable(model, x[1:4] >= 0)

@objective(model, Max, 120x[1] + 80x[2])

@constraint(model, 2*x[1] + x[2] + x[3] == 6)
@constraint(model, 7*x[1] + 8*x[2] + x[4] <= 28)
@constraint(model, x[3] - 0.5*x[4] == 2.5)

optimization_result = optimize!(model)</pre>
```

```
Running HiGHS 1.6.0: Copyright (c) 2023 HiGHS under MIT licence terms Presolving model 2 rows, 3 cols, 6 nonzeros 2 rows, 3 cols, 6 nonzeros
```

```
Presolve: Reductions: rows 2(-1); columns 3(-1); elements 6(-2)
Solving the presolved LP
Using EKK dual simplex solver - serial
  Iteration
                   Objective
                                 Infeasibilities num(sum)
              -4.9998787442e+01 Ph1: 2(3.375); Du: 2(49.9988) Os
          0
               -2.8000000000e+02 Pr: 0(0) 0s
Solving the original LP from the solution after postsolve
Model
        status
                    : Optimal
Simplex
          iterations: 2
                   : 2.8000000000e+02
Objective value
HiGHS run time
                               0.00
El resultado es:
  value.(x)
4-element Vector{Float64}:
 -0.0
  3.5
  2.5
  0.0
```

Ramificación 1

Con lo cual decidimos ramificar en la variable x_3 , dado que tuvimos soluciones fraccionadas:

Nodo 1

```
model = Model(HiGHS.Optimizer)
@variable(model, x[1:4] >= 0)

@objective(model, Max, 120x[1] + 80x[2])

@constraint(model, 2*x[1] + x[2] + x[3] == 6)
@constraint(model, 7*x[1] + 8*x[2] + x[4] <= 28)
@constraint(model, x[3] - 0.5*x[4] == 2.5)
@constraint(model, x[3] >= 3)

optimization_result = optimize!(model)
```

```

Solution status

Por lo tanto la solución es la del nodo 1

Verdadera solución

De hecho la solución final del problema es:

```
using JuMP, HiGHS
  model = Model(HiGHS.Optimizer)
  Ovariable(model, x[1:4] >= 0, Int)
  Objective(model, Max, 120x[1] + 80x[2])
  @constraint(model, 2*x[1] + x[2] + x[3] == 6)
  @constraint(model, 7*x[1] + 8*x[2] + x[4] \le 28)
  @constraint(model, x[3] - 0.5*x[4] == 2.5)
  optimization_result = optimize!(model)
  value.(x)
